

Learning with AI

Preston Jackson

Restating Goal for AI

- AI Book Recommendations
- AI Goal Creation Assist

AI Book Recommendations

Reactive Machine AI

- Simplest form of AI

How it Works:

- Takes books from API database
- Takes books from Bookeep's stored books
- Compares books based off users books with a point value system
- Creates file and presents the top scoring books on BookHelp

What I Learned from This

- AI can do really well making simple recommendations
- However, model has high recency bias (Author of most recent book favored)
- AI translates books for itself and recommends non-English books. Had to manual filter them out from API.

Goal Setting Assists

- Takes test outcomes stored in data (Time between books logged, test history)
- Generates a "Recommended Goal" for WPM goal and Comprehension Goal + Streak Expectations
- User chooses if AI should set a quick goal, recommended goal, or an optimistic goal

What I Learned from This

- AI goals were extremely optimistic, even with quick goals at first. Had to tweak.
- Then, AI was tip-toeing up for goals (Made goals increase by 1 WPM for quick... technically works, but can be better)
- Overall, it fought me every step of the way

Writing to AI

- Claude's token limit is stupid
- I started off this project still not giving AI enough information, so it guesses so much for development. Much AI troubleshooting early on.
- Now, my prompts (or AIs reading capabilities) have grown; Notice that AI feedback or code snippets are much better and accurate to my design
